

**Date:** 15 June 2019 . 98/3/25.

**Patient's Name:** F.K.

**Responsible Physician:** Dr.Mashayekhi.

**Patient Presentation:**

-A 48 year old female which has been underwent BCS with no axillary staging and adjuvant RT for left breast cancer 10 years ago, now presented with inflammation and stiffness of whole left breast.

-CNB of the breast has shown just inflammatory cells. Her metastatic work up is negative.

**Question:** Rebiopsy or mastectomy?

**Recommended Plan:** Breast MRI and abdominopelvic CT scan review revealed two masses in lateral of the breast and axilla, a mass in ascending colon and some suspicious lesions in liver. Colonoscopy and biopsy of mentioned lesions of breast, axilla, and liver was recommended.

Inflammation and stiffness in left breast of the patient.
