

**Date:** 13 July 2019. 98/4/22.

**Patient's Name:** A.A.

**Responsible Physician:** Dr. Miri.

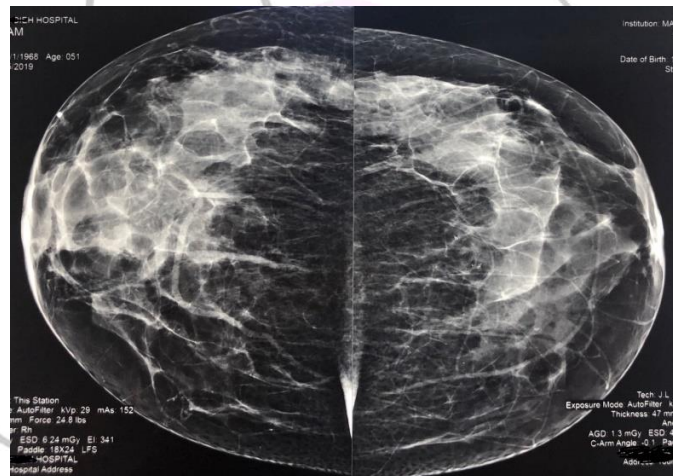

**Patient Presentation:**

-A 51 year old female with breast cancer (IDC on CNB) underwent MST+SLNB with negative sentinel LN on frozen section analysis.

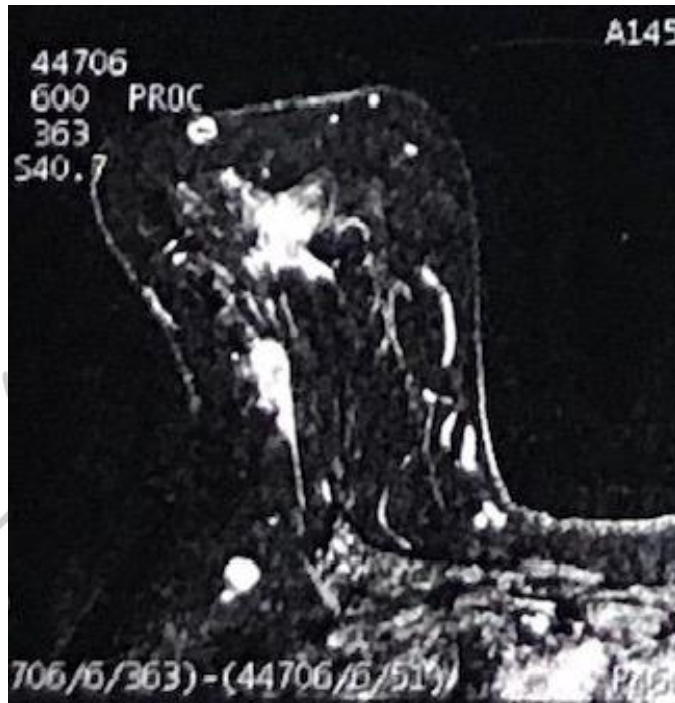

-Permanent pathology examination reported: DCIS (no residual IDC), SLN: micrometastasis, NSLN: involved.

**Question:** What should be done for axilla treatment: completion surgery or just RT?

**Recommended Plan:** IHC and axillary US should be done to decide about treatment of the axilla.

Mammogram of the patient which shows right periareolar skin thickening.

Breast MRI of the patient which shows right suspicious breast lesion and suspicious axillary LN.
