

**Date:** 07.08.2021; 1400.05.16

**Patient's Name:** H.Z

**Responsible Physician:** Dr.Ebrahimi

**Patient presentation:**

A 43 year-old lady with left breast mass since 4 months ago.  
CNBx: invasive lobular carcinoma, G2/3, ER +PR +HER - Ki67 5%,  
Axillary FNA:highly suspicious for malignancy  
Underwent lumpectomy +ALND: ILC at least six tumors, greatest one 3.2 cm. skin has dermal invasion by tumor ,medial margin is very close. LVI & PNI present tumor deposits present in axillary fat,19/37 LNs involved by tumor  
T4N3

**Question:**

What's the next plan?

Are there any lesions on MRI study?

**Recommendation:**

1. Mastectomy is recommended. (If it is refused by patient, the decision should be made again after breast MRI)
