

Date:27.11.2021; 1400.09.06

Patient's Name:F.B

Responsible Physician: Dr.Elahi

Patient presentation: A 40 year-old lady presented with right anterior chest wall mass which was excised.

PMH: she had thyroid surgery 15 years ago & also excision of chest wall mass 7 years ago.

Sonography : few cysts with the diameter of 3 mm B2

Mamo: scattered punctate microcalcification B2

Bone scan: Normal

CT scan: some hypodense masses in liver probably hemangioma

Pathology of excisional mass: suspicious for metastatic carcinoma (more probably poorly differentiated thyroid carcinoma)

IHC: highly suggestive of carcinoma probably adenocarcinoma

Path review: cutaneous adenomyoepithelioma

Question:

What's the next plan?

Recommendation:

- 1.Reexcision with safe margin
- 2.No systemic therapy.
