

Date: 14.10.2023; 1402/07/22

Patient's Name: P.A

Responsible Physician: Dr.Esphandbod

Patient presentation: A 44 year-old woman had arthroplasty due to fracture of right Femor. Biopsy of arthroscopy showed metastatic cancer. She underwent Neoadjuvant chemotherapy without prior biopsy from breast mass. After NAC she underwent PET scan and MRI.

CNB: ER: 90%, PR: negative, Ki67: 25%, HER-2: negative.

CT scan: 18*16mm mass in left breast.

PET scan: Uptake in left breast.

MRI: Enhancement.

Question:

What is the next plan?

Recommended plan:

- Since localization wasn't possible and she has undergone Mastectomy and SLNB, she might benefit from Radiotherapy due to her thick skin.
