Patient's Name: Z.J

Responsible Physician: Dr.Shirkhoda

Patient presentation: A 72 year-old woman that underwent TAHBSO in year 1399 (ovarian tumor, epithelial), then Chemotherapy for many cycles and Lumpectomy of same breast twice, few years ago which were benign. She has taken 2.5 months of Tamoxifen due to surgery.

CT scan: Node in para Aorta (Retroperitoneal recurrence).

PET scan: Node in left breast.

Sonography and Mammography: 12*8mm mass in left Breast.

CNB: IDC, LVI: negative, Grade: 3, ER: 50%, PR: 70%, HER-2: negative, Ki67: 7%.

Question:

Should surgery of Retroperitoneal & Breast be done at the same time?
Does she need chemotherapy and rest of plan since Ovarian surgery is palliative?

Recommended plan:

- Lumpectomy and SLNB.
