Patient's Name: SH.GH

Responsible Physician: Dr.Majidinejad

Patient presentation: A 64 year-old woman with locally advanced left breast cancer (T3, N1, triple negative, Ki67: 10 %) underwent BCS and ALNB after neoadjuvant chemotherapy. In the surgical pathologic results, the tumor size was 7mm and the nipple margin was involved (scattered). No lymph nodes were found in the axillary tissue.

Question:

What is the next treatment plan?

Recommended plan:

During the surgery, the nipple was removed and the axilla was completely fibrotic, and the fibrotic tissue was removed during the surgery.

- Adjuvant Radiotherapy
