

Date: 23.12.2023; 1402/10/02

Patient's Name: S.K

Responsible Physician: Dr.Sarkarde

Patient presentation: A 40 year-old woman with right Breast mass (IDC, ER: negative, PR: negative, HER: negative, Ki67: 10%). She underwent NAC, BCS and SLNB in 1401 and then Radiotherapy. Relapse under Radiotherapy as skin lesion happened.

Biopsy: ER: negative, PR: negative, HER-2: negative, Ki67: 90%.

In further evaluation lung and liver metastasis, mass in left breast and left axilla was found. IHC is the same as before (ER: negative, PR: negative, HER-2: negative). She underwent Adjuvant chemotherapy and progression of skin lesion was seen under chemotherapy.

Question:

What is the next plan?

Recommended plan:

In CT review:

Multiple lung and liver Metastasis and Carcinomatosis Lymphangitis.

No benefits from surgery or Radiotherapy.

- Continue Systemic Chemotherapy.
