

Date: 29.06.2024; 1403/04/09

Patient's Name: M.A

Responsible Physician: Dr.Akhavan

Patient presentation: A 42-year-old woman underwent right oophorectomy and omental biopsy, and the pathology was suspicious to be cyst adenocarcinoma 20 years ago. In 1403, the patient underwent surgery following cord compression, which suggested metastasis from the breast origin. PET CT scan showed, an 18mm right breast mass and a solid cystic mass were reported in the left adnexa.

Question:

What is the best treatment plan?

Recommended plan:

- 1- Genetic consultation
- 2- Review slides of pathology
- 3- IHC test
- 4- If metastatic breast cancer was confirmed, medical treatment base on IHC is recommended
