Patient's Name: E.A

Responsible Physician: Dr.Omranipour

Patient presentation: A 21-year-old woman who has felt in right breast three years ago, and after the increase in the size of the mass, she underwent a biopsy. The pathology suggested fibromatosis. The tumor was excised with free margin. After touching the mass again in the same area, according to the suspicious finding in the ultrasound, she underwent a biopsy again, which showed the pathology of fibromatosis, which was also confirmed in the review of the slides. In the CT scan of the patient, the mass 3-cm right parasternal lesion was seen without bone destruction.

Question:

What is the treatment plan?

Recommended plan:

- 1- Medical treatment
- 2- Wait and watch Sorafinib
