Patient's Name: R.B

Responsible Physician: Dr.Esphandbod

Patient presentation: A 70-year-old woman with a history of inflammatory cancer of the right breast who underwent neoadjuvant chemotherapy, Radiation therapy and Letrozole treatment (1397) had a relapse in 1399 (supraclavicular lymph node confirmed with biopsy), which was reported in the PET-CT scan of multiple bone metastases. The patient underwent Chemotherapy with CMF (rise of creatinine, dialysis) and then Aromasine and Palbociclib.

Question:

Considering skin involvement and lack of response to chemotherapy, what treatment is suggested?

Recommended plan:

- Palliative radiotherapy; if responded to Radiotherapy palliative surgery could be done.
