Patient's Name: F.B

Responsible Physician: Dr.Omranipour

Patient presentation: A 41-year-old woman is examined due to blood discharge from her left nipple. According to the dilated ducts in the UIQ, she underwent vacuum assistant biopsy, which suggests DCIS. The patient undergoes a lumpectomy with a guide wire. In the final pathology, the medial and inferior margin was involved with DCIS foci, lateral margin was involved.

Question:

What is the next treatment plan?

Recommended plan:

- Mastectomy and early reconstruction with prosthesis and SLNB.
