

**Date:** 08.06.2024; 1403/03/19

**Patient's Name:** F.B

**Responsible Physician:** Dr.Esphandbod

**Patient presentation:** A 44-year-old woman who underwent BCS due to triple-negative left breast cancer, followed by Chemotherapy and Radiation therapy. Due to recurrence, she underwent MRM due to local recurrence and is treated with Tamoxifen and Capecitabine. Due to recurrence in mastectomy bed with ulcer and contralateral breast involvement underwent resection of the site of recurrence and MRM on the opposite side, followed by treatment with Docetaxel and Xeloda. In the latest PET-CT scan, the involvement of the right mastectomy bed, left parasternal recurrence and pulmonary nodules were reported.

**Question:**

What is the next treatment plan?

**Recommended plan:**

- Palliative surgery

Figure 1: Skin lesion in Mastectomy bed.

Figure 2: Hyper metabolic lesion in PET-CT scan.

Figure 3: PET-CT scan shows pulmonary nodule.
