

**Date:** 05.10.2024; 1403/07/14

**Patient's Name:** S.A

**Responsible Physician:** Dr.Elahi

**Patient presentation:** A 64-year-old woman with negative family history of breast cancer.

1394:

She has undergone surgery (left BCS and ALND, Tumor close to margin, Lymph nodes: 0/4, ER: positive) after chemotherapy.

1401:

Left breast tail recurrence attach to skin 3\*4cm. So she received chemotherapy then surgery (Left total mastectomy, ALND, wide skin resection over tumor) and Radiotherapy.

Pathology:

Tumor size: 20mm, ER: 40%, HER-2: Triple positive, Ki67:20%.

1403/06:

There are 2 purple round skin lesions on medial of mastectomy flap.

Punch biopsy: Atypia

PET-CT scan: Medial MST bed & left axillary mild activity. Right paratracheal & left hilar adenopathy SUV7.

**Question:**

What is the next treatment plan? Is she Metastatic or not?

**Recommended plan:**

- 1- Surgery
- 2- Check IHC
- 3- PDL1
