

Date: 28.09.2024; 1403/07/07

Patient's Name: M.N

Responsible Physician: Dr.Alipour

Patient presentation: A 38-year-old woman known case of IGM without family history of breast cancer.

She has been treated with corticosteroid till Farvardin 1403.

She has been worked up due to palpable mass in left breast (2-3 o'clock) in Mordad.

CBN Biopsy was done and the pathologic results were fibroepithelial neoplasm in favor of phyllodes tumor.

The mass was excised and the final pathologic results were borderline phyllodes (7.5 cm) and all margins were free.

Question:

Is pregnancy safe for her?

Recommended plan:

- Radio oncologic consultation
- Genetic consult
