

Date: 21.12. 2024; 1403/10/01

Patient's Name: FM

Responsible Physician: Dr. Esfandbod

Patient presentation: A 50 Y/O F underwent Rt. MRM (1401), then endocrine therapy for 2 years

She was under observation, and a PET scan was done for her PET:

Multiple bone metastases, pleura, and lung metastases,
Cytology of pleural effusion: inflammatory
BONE SCAN: normal

Question:

Next Plan?

Recommended plan: PET review:

Bone lesions aren't metastatic

But the lung nodule is suspicious, so a lung biopsy was advised.

PET SCAN shows a suspicious lung nodule
