

**Date: 15.11.2025; 1404/08/24**

**Patient's Name: R.M**

**Responsible Physician: Dr. Omranipour**

**Patient presentation:**

50 Y/O female, she underwent a BCS+SLNB in other hospital for left breast mass.

**Pathology review:**

**A:** left breast partial mastectomy: IDC, G3

**B:** left subareolar mass excision: HG DCIS

C, D, E, F: margins: free

G: left sub-axillary tissue: fibroadipose tissue without LN U/S: post op changes in left and no significant finding in right breast or both axillary region

**Staging CT:** no metastasis

**Bone scans:** any metastasis

**Question:**

Does she need to perform proper axillary staging or start adjuvant treatment?

**Recommended plan:**

First recommendation is to perform tomosynthesis and surgery. If patient does not accept assess FISH and perform adjuvant chemotherapy.
