

Date: 20.09.2025; 1404/06/29

Patient's Name: M.H

Responsible Physician: Dr.S.Karimi

Patient presentation:

38 Y/O woman with prior luminal-type invasive breast cancer treated with breast-conserving therapy who did not complete planned adjuvant systemic treatment.

6-7 months later Now presents with a new mass at the prior lumpectomy site; core biopsy shows triple-negative invasive carcinoma (TNBC), Ki-67 20% indicating receptor conversion; the patient is reluctant to undergo mastectomy

Question:

What is the next step?

Recommendation plan:

Proceed to mastectomy and axillary dissection
