**Date: 1405/08/02, 2026/10/24**

**Patient's Name: F.E.**

**Responsible Physician: Dr. Ebrahimi**

**Patient Presentation:**

A 21Y/O woman presented with an enlarging 33 mm mass in the right breast, classified as BI 4a on imaging.

CNB revealed a fibro epithelial lesion suggestive of a phyllodes tumor, with cellular fibroadenoma included in the differential diagnosis.

The patient underwent simple lumpectomy. Final histopathological examination revealed an intermediate-grade phyllodes tumor with cellular atypia.

**Question:**

1. What is the recommended surgical management?

2. Is adjuvant radiotherapy indicated?

**Recommended Plan:**

- ✓ Pathology review is recommended. If the diagnosis of borderline phyllodes tumor is confirmed, re-excision of the surgical margins is recommended.
