Date: 1405/08/02, 2026/10/24

Patient's Name: S.M.

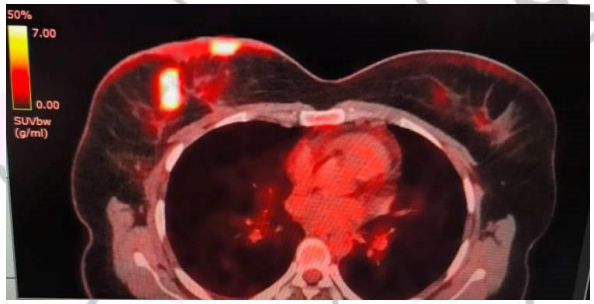

Responsible Physician: Dr. Harirchi

Patient Presentation:

A 37 Y/O woman with a history of right breast cancer and liver metastases underwent BCS+ALND in 2023 (1402).

Histopathology revealed invasive ductal carcinoma (IDC).
She received adjuvant chemotherapy, with her last cycle administered on September 12, 2026 (21/6/1405).
PET scans over the past two years have shown no evidence of liver metastases. However, a mass is currently present in the right breast.

Question:

Should she undergo surgery, or should systemic chemotherapy be continued?

Recommended Plan:

- ✓ On postoperative review of the breast MRI, a sub areolar lesion suspicious for loco regional recurrence was identified, which has never been biopsied. Targeted ultrasound and biopsy are recommended as the initial steps.
